

AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

Team Leader: VEERA OVIYA V

Team Members: SATHANA S, SANGAVI M, SOWMIYA V

2. PROJECT REQUIREMENTS ANALYSIS

2.1 Data Flow Diagram (DFD)

The Data Flow Diagram shows how the ticket moves through the system.

Flow:

User → Create Ticket → ServiceNow → Flow Designer → Analyze Ticket Details → Classify Ticket → Assign to Appropriate Team → Update Ticket

DFD Explanation

1. The user creates a support ticket in ServiceNow.
 2. The ticket contains details such as description, category, priority, and other required information.
 3. Flow Designer receives the newly created ticket.
 4. The flow checks the predefined conditions.
 5. Based on the ticket details, the system automatically identifies the appropriate category.
 6. The ticket is assigned to the correct assignment group.
 7. The ticket information is updated and stored in ServiceNow.
-

2.2 User Stories

User Story 1:

As a user, I want to create a ticket so that I can report my issue to the support team.

User Story 2:

As a service desk agent, I want tickets to be automatically classified so that I can reduce manual work.

User Story 3:

As an administrator, I want tickets to be automatically assigned to the appropriate team so that the issue can be handled quickly.

User Story 4:

As a support team member, I want to receive correctly classified tickets so that I can focus on resolving the issue.

User Story 5:

As a manager, I want an automated ticket classification system so that ticket processing becomes faster and more efficient.

2.3 Solution Requirements

Functional Requirements

- The system should allow users to create tickets.
- The system should automatically detect newly created tickets.
- Flow Designer should analyze the ticket details.
- The system should classify tickets based on predefined conditions.
- The system should automatically assign tickets to the appropriate assignment group.
- The system should update the ticket after classification.
- The system should notify the responsible team.

Non-Functional Requirements

- The system should be easy to use.
 - The system should process tickets quickly.
 - The system should provide reliable results.
 - The system should maintain data security.
 - The system should be easy to maintain and modify.
 - The system should support future enhancements.
-

2.4 Technology Stack

Technology	Purpose
ServiceNow	Main platform for ticket management
Flow Designer	Automates ticket classification and assignment

Technology	Purpose
ServiceNow Tables	Stores ticket information
JavaScript	Used for scripting/custom logic when required
Web Browser	Accessing the ServiceNow platform
ServiceNow Developer Instance	Development and testing environment

Expected Outcome

The proposed system automatically classifies incoming tickets and assigns them to the appropriate support team using **ServiceNow Flow Designer**. This reduces manual effort, minimizes classification errors, and improves the efficiency of ticket management.
