

## **AUTO TICKET CLASSIFICATION USING FLOW DESIGNER**

**Team Leader:** VEERA OVIYA V

**Team Members:** SATHANA S, SANGAVI M, SOWMIYA V

### **3. PROJECT DESIGN**

#### **3.1 System Design**

The system is designed to automatically classify incoming support tickets using **ServiceNow Flow Designer**. When a ticket is created, the flow checks the ticket information and performs the required actions automatically.

#### **3.2 System Workflow**

**User → Create Ticket → Trigger Flow → Check Ticket Details → Apply Conditions → Classify Ticket → Assign Assignment Group → Update Ticket**

##### **Workflow Explanation**

1. The user creates a new support ticket in ServiceNow.
2. The Flow Designer flow is triggered automatically when the ticket is created.
3. The flow reads the ticket details such as description, category, priority, and other fields.
4. Conditions are applied to identify the type of issue.
5. Based on the conditions, the ticket is automatically classified.
6. The ticket is assigned to the appropriate assignment group.
7. The ticket record is updated with the classification and assignment details.

---

#### **3.3 Flow Designer Design**

The Flow Designer consists of the following major components:

##### **Trigger:**

The flow starts when a new ticket is created.

##### **Conditions:**

The system checks predefined conditions based on ticket information.

##### **Actions:**

The flow updates the ticket category and assignment group.

##### **Notification:**

The responsible support team can be notified after the ticket is assigned.

---

### 3.4 Ticket Classification Design

| Ticket Type    | Classification | Assignment Group |
|----------------|----------------|------------------|
| Hardware Issue | Hardware       | Hardware Support |
| Software Issue | Software       | Software Support |
| Network Issue  | Network        | Network Support  |
| Access Issue   | Access         | Service Desk     |

The classification rules can be modified according to the organization's requirements.

---

### 3.5 User Interface Design

The ticket form contains important fields such as:

- Short Description
- Description
- Category
- Subcategory
- Priority
- Caller
- Assignment Group
- State

The user enters the required ticket information, and the Flow Designer automatically processes the ticket.

---

### 3.6 Database Design

The ticket information is stored in the **ServiceNow Incident table**. The system uses the existing ticket fields to classify and assign incidents.

Important fields include:

- Incident Number
- Short Description

- Description
- Category
- Priority
- Assignment Group
- State
- Caller

---

### **3.7 Expected Design Outcome**

The final design provides an automated workflow for ticket classification and assignment. It reduces manual processing, improves consistency, and helps the support team handle tickets efficiently.
