

AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

Team Leader: VEERA OVIYA V

Team Members: SATHANA S, SANGAVI M, SOWMIYA V

5. PROJECT DEVELOPMENT

5.1 Development Overview

The development phase focuses on implementing the **Auto Ticket Classification Using Flow Designer** project in the ServiceNow platform. The system is developed using **Flow Designer** to automatically classify and assign tickets based on predefined conditions.

5.2 Development Process

The project is developed through the following steps:

1. Create and configure the required ticket fields.
2. Create a new flow in **Flow Designer**.
3. Configure the trigger for newly created tickets.
4. Add conditions for identifying different ticket types.
5. Configure actions for ticket classification.
6. Automatically assign the ticket to the appropriate assignment group.
7. Update the ticket information.
8. Test the flow using different ticket examples.

5.3 Flow Designer Configuration

The flow contains three main components:

Trigger → Conditions → Actions

Trigger:

The flow starts automatically when a new ticket/incident is created.

Conditions:

The system checks the ticket information, such as the short description, category, or other relevant fields.

Actions:

Based on the conditions, the system updates the ticket category and assigns it to the appropriate support group.

5.4 Ticket Classification

The system uses predefined rules to classify tickets.

Ticket Details	Classification	Assignment Group
Hardware-related issue	Hardware	Hardware Support
Software-related issue	Software	Software Support
Network-related issue	Network	Network Support
Access-related issue	Access	Service Desk

5.5 Testing

Different types of tickets are created to verify whether the flow works correctly.

Test Case 1:

Create a hardware-related ticket → System classifies it as **Hardware** → Assigns it to **Hardware Support**.

Test Case 2:

Create a software-related ticket → System classifies it as **Software** → Assigns it to **Software Support**.

Test Case 3:

Create a network-related ticket → System classifies it as **Network** → Assigns it to **Network Support**.

5.6 Development Result

The developed system successfully automates the ticket classification and assignment process using **ServiceNow Flow Designer**. It reduces manual effort and ensures that tickets are routed to the appropriate support team based on predefined rules.

5.7 Expected Outcome

The final development provides:

- Automatic ticket classification.
- Automatic assignment to support groups.
- Reduced manual work.
- Faster ticket processing.
- Consistent classification.
- Improved ticket management.
