

AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

Team Leader: VEERA OVIYA V

Team Members: SATHANA S, SANGAVI M, SOWMIYA V

6. PROJECT DOCUMENTATION

6.1 Introduction

Project documentation is the process of recording all the important information related to the **Auto Ticket Classification Using Flow Designer** project. It includes the project objectives, requirements, design, development process, testing results, and final outcome.

The documentation helps the team to clearly explain how the project was planned, developed, tested, and implemented.

6.2 Project Objective

The main objective of the project is to automate the classification and assignment of support tickets using **ServiceNow Flow Designer**.

The system reduces manual effort and helps the support team process tickets efficiently.

6.3 Problem Statement

In a traditional ticket-management process, support agents manually check each ticket and assign it to the appropriate category and team. This can take time and may result in incorrect classification.

The proposed system solves this problem by automatically classifying tickets using predefined conditions in Flow Designer.

6.4 Technologies Used

- **ServiceNow** – Main development platform
- **Flow Designer** – Workflow automation
- **ServiceNow Incident Table** – Ticket data storage
- **JavaScript** – Custom scripting when required
- **Web Browser** – Accessing ServiceNow
- **ServiceNow Developer Instance** – Development and testing

6.5 Project Modules

The project consists of the following modules:

1. Ticket Creation Module

Allows users to create support tickets by entering the required information.

2. Ticket Classification Module

Uses predefined conditions to identify the type of ticket.

3. Automatic Assignment Module

Assigns the classified ticket to the appropriate support group.

4. Flow Automation Module

Uses Flow Designer to automate the complete ticket-processing workflow.

5. Testing Module

Tests different ticket types to verify the correct classification and assignment.

6.6 Testing Documentation

Different test cases are used to verify the system.

Test Case Input		Expected Result	Status
TC01	Hardware issue	Hardware Support	Pass
TC02	Software issue	Software Support	Pass
TC03	Network issue	Network Support	Pass
TC04	Access issue	Service Desk	Pass

6.7 Screenshots

The project documentation should include screenshots of:

- ServiceNow login/developer instance
- Incident/Ticket creation form
- Flow Designer
- Trigger configuration
- Conditions
- Actions
- Ticket classification result
- Assignment group
- Final output

6.8 Project Result

The implemented system automatically classifies newly created tickets and assigns them to the appropriate support team using Flow Designer.

The project reduces manual classification, improves ticket handling, and provides a systematic workflow for managing support tickets.

6.9 Conclusion

The **Auto Ticket Classification Using Flow Designer** project demonstrates how ServiceNow automation can be used to improve IT support operations. By automatically classifying and assigning tickets, the system reduces repetitive manual tasks and helps support teams manage incoming tickets more efficiently.
